1 About This Reference Manual

This document is a reference of all the Setting Values, Direct Commands and Signals of the MCA4. In other words, it lists all parameters that are available (or can be made available) with the (optionally) full featured versions of the MCA4 protection device.

CAUTION!

This document does not intend to give long and/or detailed description, nor does it intend to replace the full Technical Manual in any way. Only a quite short description is given for each parameter.

This document is a reference of all the Setting Values, Direct Commands and Signals of the MCA4.

Every HighPROTEC protection device operates using a lot of digital values of various types. Throughout our Technical Documentation, we are talking of “settings” (or “parameters”) or “signals” or “(measured) values”, depending on the type.

Please consult the Technical Manual, in particular Chapter “Modules, Settings, Signals and Values”, for details of the existing data types.

Modules

The firmware of every HighPROTEC protection device can be thought of being sub-divided in several independent function blocks, the so-called “modules”. Every protection function, for example, is a module of its own. But one of the fundamental concepts of a HighPROTEC protection device is to implement this with great consequence.

There is even a general protection module (named »Prot«) that interacts all specific protection modules.

Every parameter, every value and every signal is therefore a member of some module.

But note that the settings dialogs (on the panel (HMI) or in the *Smart view* operating software) often omit the module name whenever it is clear from the menu branch. This means the parameters are often displayed only with their individual parameter names, i. e. simply »Function« instead of the full-blown »I2>[1] . Function«. This increases the overview and simplifies all configuration and operation work; however, it is good to know that the writing »Function« is just an abbreviation. In fact, **every** parameter **always** belongs to a module, and therefore – to make this concept absolutely clear – the reference tables have always the module name added in front of every parameter name

Especially for protection functions it is often required to have several instances active. For example, overcurrent protection usually has several “stages”, and all of these are running at the same time (using their individual setting values). Therefore it is an important feature of every HighPROTEC protection device that a lot of modules exist in several “instances”, which are numbered (in brackets), for example: »I2>[1]«, I2>[2]«

In the reference tables, usually every module has its own dedicated chapter, which lists the available number of instances at the beginning. Then, however, in the sub-chapters listing the various parameter types, only the first instance (e. g. »I2>[1]«) is mentioned, because all the other instances are identical anyway.

Structure of a Reference Table

Since (almost) every module can be activated or deactivated independently of the other modules and all parameters of an inactive module disappear from the menu branch it would not be helpful if this Reference Manual would list parameters sorted according to the menu structure. Instead, we list categories of modules (e. g. “Protection Functions”) and all the modules within a category.

For each parameter, there is a table with its properties, looking like this:

Module . Parameter		[Menu Path to This Parameter]
Default Value		Value Range
For some parameters:		
	<ul style="list-style-type: none"> • Availability restrictions 	
Type	Short descriptive text explaining the functionality of this parameter.	

“Type” is the data type of the parameter, which is denoted by a small icon. The following types are possible:

-  Setting Parameter
-  Direct Control
-  Input State
-  Signal (Output State)
-  Statistical Value
-  Counter
-  (Measuring) Value
-  Dialog — Such a dialog can feature several data objects using a special representation and/or functionality.

“Perm.” means “permission”, i. e. the access level and password that is required to modify the parameter. (Please refer to the “Security” chapter in the full Technical Manual for details.)

Several “access levels” exist, each having its individual password setting. (Each password is settable and can also be deactivated, see the MCA4 User Manual.)

In particular, the following permissions (access levels) can exist:

Short Designation in this Reference Manual	Name of Access Area (Panel or Smart view)	Access to:
"RO"	Read Only-Lv0	Level "RO" provides <i>Read Only</i> access to all settings and parameters of the device. The device will fall back into this level automatically after a configurable period or inactivity.
"P.1"	Prot-Lv1	This password provides access to the reset- and acknowledge options. In addition to that, it permits the execution of manual trigger signals.
"P.2"	Prot-Lv2	This password provides access to the reset and acknowledge options. In addition to that it permits changing of protection settings and the configuration of the trip manager.
"C.1"	Control-Lv1	This password grants permission for switching operations (switching switchgears).
"C.2"	Control-Lv2	This password grants permission for switching operations (switching switchgears). In addition to that it gives access to the switchgear settings (switching authority, interlockings, general settings of switchgears, Breaker wear...).
"S.3"	Supervisor-Lv3	This password grants non-restricted access to all parameters and settings of the device (device configuration). This includes also the devices planning, device parameters (e.g. Date and Time), Field Parameters, Service Parameters and Logic Parameters.

"⊕ Adapt. Param." means that this parameter supports Adaptive Parameter Sets. (See the "Adaptive Parameter Sets" section in the User Manual.)

For some parameter types (e. g. Input and Output States), the second row (default, value range, permission) is useless and therefore omitted.

Example of a parameter:

Exp[1] . Mode	[Device planning]	
use	-, use  Mode	S.3
 <i>general operation mode</i>		

This means that one can find the parameter in the menu [Device planning], and its values are picked from a selection list named "Mode". The "" arrow indicates a cross-reference (hyperlink) into the "Selection Lists" chapter, and a click takes you to a table that lists all available choices.

The access level "S.3" means the access level "Supervisor-Lv3", which is required to modify the parameter.

Audience of This Manual

The manual serves as working basis for:

- Engineers in the protection field,
- commissioning engineers,
- people dealing with setting, testing and maintenance of protection and control devices,
- as well as trained personnel for electrical installations and power stations.

All functions concerning the MCA4 are listed. Should there be a description of any functions, parameters or inputs/outputs which do not apply to the device in use, please ignore that information.

This manual describes the (optionally) full featured versions of the devices.

All technical information and data included in this manual reflect their state at the time this document was issued. We reserve the right to carry out technical modifications in line with further development without changing this manual and without previous notice. Hence no claim can be brought based on the information and descriptions this manual includes.

An incorrect polarity/wiring can be corrected by means of the settings "0°" or "180°". The operator has the possibility of turning the current vector by 180 degrees (change of sign) without modification of the wiring. This means, that - in terms of figures - the determined current indicator was turned by 180° by the device.

	»I<«	To prevent unintended operation during faults, this threshold should be used to distinguish between load current and overcurrent. A current above this threshold will be seen as overcurrent and LOP will be inhibited. If the current detector identifies load current as overcurrent (threshold to low), a LOP situation will not be detected and if the threshold is too high, a fault situation will be identified as LOP which results in blocking of protection functions.
	»t-Alarm«	Pickup Delay
	»Dead Bus Detection«	If this detection is active, LOP will be inhibited if there is no current and voltage applied.

1..n, Assignment List	Description
Fault No.	Fault number
No. of Grid Faults	Number of grid faults: This is a counter for all faults (i.e. General Alarms »Prot . Alarm«), but except faults during a running cycle of the Automatic Reclosure module (signal »AR . running«). (Remark: The »Fault No.« counts every new fault independent of AR cycles. This means that for protective devices without AR module these two counters are equivalent.)
TripCmd Cr	Counter: Total number of trips of the switchgear.
