1 About This Reference Manual

This document is a reference of all the Setting Values, Direct Commands and Signals of the MRI4. In other words, it lists all parameters that are available (or can be made available) with the (optionally) full featured versions of the MRI4 protection device.

CAUTION!

This document does not intend to give long and/or detailed description, nor does it intend to replace the full Technical Manual in any way. Only a quite short description is given for each parameter.

This document is a reference of all the Setting Values, Direct Commands and Signals of the MRI4.

Every HighPROTEC protection device operates using a lot of digital values of various types. Throughout our Technical Documentation, we are talking of “settings” (or “parameters”) or “signals” or “(measured) values”, depending on the type.

Please consult the Technical Manual, in particular Chapter “Modules, Settings, Signals and Values”, for details of the existing data types.

Modules

The firmware of every HighPROTEC protection device can be thought of being sub-divided in several independent function blocks, the so-called “modules”. Every protection function, for example, is a module of its own. But one of the fundamental concepts of a HighPROTEC protection device is to implement this with great consequence: The functionality of calculating statistical data is a module (named »Statistics«), every communication protocol is a module, the control of switchgear devices is a module (named »Ctrl«), but the properties of the switchgear itself is part of another module. There is even a general protection module (named »Prot«) that interacts all specific protection modules.

Every parameter, every value and every signal is therefore a member of some module.

But note that the settings dialogs (on the panel (HMI) or in the *Smart view* operating software) often omit the module name whenever it is clear from the menu branch. This means the parameters are often displayed only with their individual parameter names, i. e. simply *»Function«* instead of the full-blown *»I[1] . Function«*. This increases the overview and simplifies all configuration and operation work; however, it is good to know that the writing *»Function«* is just an abbreviation. In fact, **every** parameter **always** belongs to a module, and therefore – to make this concept absolutely clear – the reference tables have always the module name added in front of every parameter name

Especially for protection functions it is often required to have several instances active. For example, overcurrent protection usually has several “stages”, and all of these are running at the same time (using their individual setting values). Therefore it is an important feature of every HighPROTEC protection device that a lot of modules exist in several “instances”, which are numbered (in brackets): For the overcurrent protection, for example: »I[1]«, I[2]«, …

In the reference tables, usually every module has its own dedicated chapter, which lists the available number of instances at the beginning. Then, however, in the sub-chapters listing the various parameter types, only the first instance (e. g. »I[1]«) is mentioned, because all the other instances are identical anyway.

Structure of a Reference Table

Since (almost) every module can be activated or deactivated independently of the other modules and all parameters of an inactive module disappear from the menu branch it would not be helpful if this Reference Manual would list parameters sorted according to the menu structure. Instead, we list categories of modules (e. g. “Protection Functions”) and all the modules within a category.

For each parameter, there is a table with its properties, looking like this:

Module . Parameter	[Menu Path to This Parameter]	
Default Value For some parameters: • Availability restrictions	Value Range	Perm.
Type	*Short descriptive text explaining the functionality of this parameter.*	

“Type” is the data type of the parameter, which is denoted by a small icon. The following types are possible:

- 🛠 Setting Parameter
- 🔘 Direct Control
- 🡻 Input State
- 🡹 Signal (Output State)
- 🗠 Statistical Value
- # Counter
- 📏 (Measuring) Value
- 🗎 Dialog — Such a dialog can feature several data objects using a special representation and/or functionality.

“Perm.” means “permission”, i. e. the access level and password that is required to modify the parameter. (Please refer to the “Security” chapter in the full Technical Manual for details.)

“⊕→ Adapt. Param.” means that this parameter supports Adaptive Parameter Sets. (See the “Adaptive Parameter Sets” section in the User Manual.)

For some parameter types (e. g. Input and Output States), the second row (default, value range, permission) is useless and therefore omitted.

Example of a parameter:

I[1] . **Mode**	[Device planning]	
non directional	Selection List ⮡ Mode: -, non directional, forward, reverse	S.3
🛠	*general operation mode*	

This means that one can find the parameter in the menu [Device planning], and its values are picked from a selection list named “Mode”. The “⮡” arrow indicates a cross-reference (hyperlink) into the “Selection Lists” chapter, and a click takes you to a table that lists all available choices. The access level “S.3” means the access level “Supervisor-Lv3”, which is required to modify the parameter.

CT . **IL1, IL2, IL3 Cutoff Level**	[Device Para / Measurem Display / Current]	
0.005In	0.0In ... 0.100In	S.3
The Current shown in the Display or within the PC Software will be displayed as zero, if the Current falls below this Cutoff Level. This parameter has no impact on recorders.		

CT . **IG meas Cutoff Level**	[Device Para / Measurem Display / Current]	
0.005In	0.0In ... 0.100In	S.3
The measured Earth Current shown in the Display or within the PC Software will be displayed as zero, if the measured Earth Current falls below this Cutoff Level. This parameter has no impact on recorders.		

CT . **IG calc Cutoff Level**	[Device Para / Measurem Display / Current]	
0.005In	0.0In ... 0.100In	S.3
The calculated Earth Current shown in the Display or within the PC Software will be displayed as zero, if the calculated Earth Current falls below this Cutoff Level. This parameter has no impact on recorders.		

CT . **I012 Cutoff Level**	[Device Para / Measurem Display / Current]	
0.005In	0.0In ... 0.100In	S.3
The Symmetrical Component shown in the Display or within the PC Software will be displayed as zero, if the Symmetrical Component falls below this Cutoff Level. This parameter has no impact on recorders.		

CT . **CT pri**	[Field Para / CT]	
1000A	1A ... 50000A	S.3
Nominal current of the primary side of the current transformers.		

CT . **CT sec**	[Field Para / CT]	
1A	1A, 5A ↳ Ratio prim/sec.	S.3
Nominal current of the secondary side of the current transformers.		

CT . **CT dir**	[Field Para / CT]	
0°	0°, 180° ↳ Polarity.	S.3
Protection functions with directional feature can only work properly if the connection of the current transformers is free of wiring errors. If all current transformers are connected to the device with an incorrect polarity, the wiring error can be compensated by this parameter. This parameter turns the current vectors by 180 degrees.		

CT . **ECT pri**	[Field Para / CT]	
1000A	1A . . . 50000A	S.3
This parameter defines the primary nominal current of the connected earth current transformer. If the earth current is measured via the Holmgreen connection, the primary value of the phase current transformer must be entered here.		

CT . **ECT sec**	[Field Para / CT]	
1A	1A, 5A ↳ Ratio prim/sec.	S.3
This parameter defines the secondary nominal current of the connected earth current transformer. If the earth current is done via the Holmgreen connection, the primary value of the phase current transformer must be entered here.		

CT . **ECT dir**	[Field Para / CT]	
0°	0°, 180° ↳ Polarity.	S.3
Earth fault protection with directional feature depends also on the correct wiring of the earth current transformer. An incorrect polarity/wiring can be corrected by means of the settings "0°" or "180°". The operator has the possibility of turning the current vector by 180 degrees (change of sign) without modification of the wiring. This means, that - in terms of figures - the determined current indicator was turned by 180° by the device.		

4.2.2 CT: Signals (Output States)

CT . **Phase seq. wrong**	[Operation / Status Display / Supervision / Phase Sequence]
Signal that the device has detected a phase sequence (L1-L2-L3 / L1-L3-L2) that is different from the one that had been set at [Field settings / General Settings] »Phase Sequence«.

Modbus . **AllowGap**	[Device Para / Modbus / Communication / General Settings]	
inactive	inactive, active ↳ Mode.	S.3
If this parameter is active (True), the user can request a set of modbus register without getting an exception, because of invalid address in the requested array. The invalid addresses have a special value 0xFAFA, but the user is responsible for ignoring invalid addresses. Attention: This special value can be valid, if address is valid.		

Modbus . **Optical rest position**	[Device Para / Modbus / Communication / General Settings]

Selection list referenced by the following parameters:

- ⮡ Sys . Ack via »C« key

Ack via »C« key	Description
Nothing	*No elements can be simply reset via pressing the »C« key for a long time (ca. 1 second). This has the consequence that pressing the »C« key is only a shortcut to the Acknowledge menu, from which the user has to select the elements to be reset.*
Ack LEDs w/o passw.	*All LEDs are acknowledged (reset) via pressing the »C« key for ca. 1 second. No password has to be entered for this. The reset activity can be recognized from the fact that it always includes an LED test, i.e. all LEDs flash in red color for a second, then flash in green color for a second.*
Ack LEDs	*All LEDs are reset via pressing the »C« key (for ca. 1 second). The reset activity can be recognized from the fact that it always includes an LED test, i.e. all LEDs flash in red color for a second, then flash in green color for a second.*
Ack LEDs and relays	*All LEDs and all acknowledgeable binary output relays are reset via pressing the »C« key (for ca. 1 second). The reset activity can be recognized from the fact that it always includes an LED test, i.e. all LEDs flash in red color for a second, then flash in green color for a second.*
Ack Everything	*All acknowledgeable elements are reset via pressing the »C« key (for ca. 1 second):* *- All LEDs, and* *- all binary output relays, and* *- all latched SCADA signals, and* *- the Trip command.* *The reset activity can be recognized from the fact that it always includes an LED test, i.e. all LEDs flash in red color for a second, then flash in green color for a second.*

Scheme

Via this selection menu, the BF supervision scheme is to be selected.

Selection list referenced by the following parameters:

- ⮡ CBF . Scheme

Scheme	Description
50BF	*A Breaker Failure is detected, if the measured currents do not fall below a settable threshold within a settable time interval.*
CB Pos	*A Circuit Breaker Failure is detected after a CB open command, if the Position Contacts of the Circuit Breaker do not allow the conclusion that the Breaker is now in the Open Position within a settable time interval.*
50BF and CB Pos	*A Circuit Breaker Failure is detected if the evaluation of the Position Indicators or the evaluation of the current measurement indicate that the CB Off-Command was not excecuted. This scheme is called "Minimal Current Scheme" according to IEEEC37.119.*

Trigger
